

Package: vtreat (via r-universe)

October 11, 2024

Type Package

Title A Statistically Sound 'data.frame' Processor/Conditioner

Version 1.6.5

Date 2024-06-12

URL <https://github.com/WinVector/vtreat/>,
<https://winvector.github.io/vtreat/>

BugReports <https://github.com/WinVector/vtreat/issues>

Maintainer John Mount <jmount@win-vector.com>

Description A 'data.frame' processor/conditioner that prepares real-world data for predictive modeling in a statistically sound manner. 'vtreat' prepares variables so that data has fewer exceptional cases, making it easier to safely use models in production. Common problems 'vtreat' defends against: 'Inf', 'NA', too many categorical levels, rare categorical levels, and new categorical levels (levels seen during application, but not during training). Reference: ``'vtreat': a data.frame Processor for Predictive Modeling'', Zume, Mount, 2016, <[DOI:10.5281/zenodo.1173313](https://doi.org/10.5281/zenodo.1173313)>.

vtreat-package	<i>vtreat: A Statistically Sound 'data.frame' Processor/Conditioner</i>
----------------	---

Description

A 'data.frame' processor/conditioner that prepares real-world data for predictive modeling in a statistically sound manner. 'vtreat' prepares variables so that data has fewer exceptional cases, making it easier to safely use models in production. Common problems 'vtreat' defends against: 'Inf', 'NA', too many categorical levels, rare categorical levels, and new categorical levels (levels seen during application, but not during training). 'vtreat::prepare' should be used as you would use 'model.matrix'.

apply_transform	<i>Transform second argument by first.</i>
-----------------	--

Description

Apply first argument to second as a transform.

Usage

```
apply_transform(vps, dframe, ..., parallelCluster = NULL)
```

Arguments

vps	vtreat pipe step, object defining transform.
dframe	data.frame, data to transform
...	not used, forces later arguments to bind by name.
parallelCluster	optional, parallel cluster to run on.

Value

transformed dframe

as_rquery_plan	<i>Convert vtreatment plans into a sequence of rquery operations.</i>
----------------	---

Description

Convert vtreatment plans into a sequence of rquery operations.

Usage

```
as_rquery_plan(treatmentplans, ..., var_restriction = NULL)
```

Arguments

treatmentplans vtreat treatment plan or list of vtreat treatment plan sharing same outcome and outcome type.

... not used, force any later arguments to bind to names.

var_restriction character, if not null restrict to producing these variables.

Value

list(optree_generator (ordered list of functions), temp_tables (named list of tables))

See Also

[rquery_prepare](#)

Examples

```
if(requireNamespace("rquery", quietly = TRUE)) {
  dTrainC <- data.frame(x= c('a', 'a', 'a', 'b', NA, 'b'),
                      z= c(1, 2, NA, 4, 5, 6),
                      y= c(FALSE, FALSE, TRUE, FALSE, TRUE, TRUE),
                      stringsAsFactors = FALSE)
  dTrainC$id <- seq_len(nrow(dTrainC))
  treatmentsC <- designTreatmentsC(dTrainC, c("x", "z"), 'y', TRUE)
  print(prepare(treatmentsC, dTrainC))
  rqplan <- as_rquery_plan(list(treatmentsC))
  ops <- flatten_fn_list(rquery::local_td(dTrainC), rqplan$optree_generators)
  cat(format(ops))
  if(requireNamespace("rqdatatable", quietly = TRUE)) {
    treated <- rqdatatable::ex_data_table(ops, tables = rqplan$tables)
    print(treated[])
  }
  if(requireNamespace("DBI", quietly = TRUE) &&
      requireNamespace("RSQLite", quietly = TRUE)) {
    db <- DBI::dbConnect(RSQLite::SQLite(), ":memory:")
    source_data <- rquery::rq_copy_to(db, "dTrainC", dTrainC,
                                     overwrite = TRUE, temporary = TRUE)

    rest <- rquery_prepare(db, rqplan, source_data, "dTreatedC",
                          extracols = "id")
    resd <- DBI::dbReadTable(db, rest$table_name)
    print(resd)

    rquery::rq_remove_table(db, source_data$table_name)
    rquery::rq_remove_table(db, rest$table_name)
    DBI::dbDisconnect(db)
  }
}
```

BinomialOutcomeTreatment

Stateful object for designing and applying binomial outcome treatments.

Description

Hold settings and results for binomial classification data preparation.

Usage

```
BinomialOutcomeTreatment(
  ...,
  var_list,
  outcome_name,
  outcome_target = TRUE,
  cols_to_copy = NULL,
  params = NULL,
  imputation_map = NULL
)
```

Arguments

...	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
outcome_name	Name of column holding outcome variable. <code>dframe[[outcomename]]</code> must be only finite and non-missing values.
outcome_target	Value/level of outcome to be considered "success", and there must be a cut such that <code>dframe[[outcomename]]==outcome_target</code> at least twice and <code>dframe[[outcomename]]!=outcome_target</code> at least twice.
cols_to_copy	list of extra columns to copy.
params	parameters list from <code>classification_parameters</code>
imputation_map	map from column names to functions of signature <code>f(values: numeric, weights: numeric)</code> , simple missing value imputers.

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [mkCrossFrameCExperiment](#), [designTreatmentsC](#), and [prepare.treatmentplan](#) for details.

buildEvalSets	<i>Build set carve-up for out-of sample evaluation.</i>
---------------	---

Description

Return a carve-up of `seq_len(nRows)`. Very useful for any sort of nested model situation (such as data prep, stacking, or super-learning).

Usage

```
buildEvalSets(
  nRows,
  ...,
  dframe = NULL,
  y = NULL,
  splitFunction = NULL,
  nSplits = 3
)
```

Arguments

<code>nRows</code>	scalar, ≥ 1 number of rows to sample from.
<code>...</code>	no additional arguments, declared to forced named binding of later arguments.
<code>dframe</code>	(optional) original data.frame, passed to user <code>splitFunction</code> .
<code>y</code>	(optional) numeric vector, outcome variable (possibly to stratify on), passed to user <code>splitFunction</code> .
<code>splitFunction</code>	(optional) function taking arguments <code>nSplits</code> , <code>nRows</code> , <code>dframe</code> , and <code>y</code> ; returning a user desired split.
<code>nSplits</code>	integer, target number of splits.

Details

Also sets attribute "splitmethod" on return value that describes how the split was performed. `attr(returnValue,'splitmethod')` is one of: 'notsplit' (data was not split; corner cases like single row data sets), 'oneway' (leave one out holdout), 'kwaycross' (a simple partition), 'userfunction' (user supplied function was actually used), or a user specified attribute. Any user desired properties (such as stratification on `y`, or preservation of groups designated by original data row numbers) may not apply unless you see that 'userfunction' has been used.

The intent is the user `splitFunction` only needs to handle "easy cases" and maintain user invariants. If the user `splitFunction` returns `NULL`, throws, or returns an unacceptable carve-up then `vtrout::buildEvalSets` returns its own eval set plan. The signature of `splitFunction` should be `splitFunction(nRows,nSplits,dframe,y)` where `nSplits` is the number of pieces we want in the carve-up, `nRows` is the number of rows to split, `dframe` is the original dataframe (useful for any group control variables), and `y` is a numeric vector representing outcome (useful for outcome stratification).

Note that `buildEvalSets` may not always return a partition (such as one row dataframes), or if the user split function chooses to make rows eligible for application a different number of times.

Value

list of lists where the app portion of the sub-lists is a disjoint carve-up of seq_len(nRows) and each list as a train portion disjoint from app.

See Also

[kWayCrossValidation](#), [kWayStratifiedY](#), and [makekWayCrossValidationGroupedByColumn](#)

Examples

```
# use
buildEvalSets(200)

# longer example
# helper fns
# fit models using experiment plan to estimate out of sample behavior
fitModelAndApply <- function(trainData, applicaitonData) {
  model <- lm(y~x,data=trainData)
  predict(model,newdata=applicaitonData)
}
simulateOutOfSampleTrainEval <- function(d,fitApplyFn) {
  eSets <- buildEvalSets(nrow(d))
  evals <- lapply(eSets,
    function(ei) { fitApplyFn(d[ei$train,],d[ei$app,]) })
  pred <- numeric(nrow(d))
  for(eii in seq_len(length(eSets))) {
    pred[eSets[[eii]]$app] <- evals[[eii]]
  }
  pred
}

# run the experiment
set.seed(2352356)
# example data
d <- data.frame(x=rnorm(5),y=rnorm(5),
  outOfSampleEst=NA,inSampleEst=NA)

# fit model on all data
d$inSampleEst <- fitModelAndApply(d,d)
# compute in-sample R^2 (above zero, falsely shows a
# relation until we adjust for degrees of freedom)
1-sum((d$y-d$inSampleEst)^2)/sum((d$y-mean(d$y))^2)

d$outOfSampleEst <- simulateOutOfSampleTrainEval(d,fitModelAndApply)
# compute out-sample R^2 (not positive,
# evidence of no relation)
1-sum((d$y-d$outOfSampleEst)^2)/sum((d$y-mean(d$y))^2)
```

center_scale	<i>Center and scale a set of variables.</i>
--------------	---

Description

Center and scale a set of variables. Other columns are passed through.

Usage

```
center_scale(d, center, scale)
```

Arguments

d	data.frame to work with
center	named vector of variables to center
scale	named vector of variables to scale

Value

d with centered and scaled columns altered

Examples

```
d <- data.frame(x = 1:5,
               y = c('a', 'a', 'b', 'b', 'b'))
vars_to_transform = "x"
t <- base::scale(as.matrix(d[, vars_to_transform, drop = FALSE]),
                 center = TRUE, scale = TRUE)

t

centering <- attr(t, "scaled:center")
scaling <- attr(t, "scaled:scale")
center_scale(d, center = centering, scale = scaling)
```

classification_parameters	<i>vtreat classification parameters.</i>
---------------------------	--

Description

A list of settings and values for vtreat binomial classification fitting. Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [mkCrossFrameCEExperiment](#), [designTreatmentsC](#), and [prepare.treatmentplan](#) for details.

Usage

```
classification_parameters(user_params = NULL)
```

Arguments

user_params list of user overrides.

Value

filled out parameter list

designTreatmentsC *Build all treatments for a data frame to predict a categorical outcome.*

Description

Function to design variable treatments for binary prediction of a categorical outcome. Data frame is assumed to have only atomic columns except for dates (which are converted to numeric). Note: re-encoding high cardinality categorical variables can introduce undesirable nested model bias, for such data consider using [mkCrossFrameCExperiment](#).

Usage

```
designTreatmentsC(  
  dframe,  
  varlist,  
  outcomename,  
  outcometarget = TRUE,  
  ...,  
  weights = c(),  
  minFraction = 0.02,  
  smFactor = 0,  
  rareCount = 0,  
  rareSig = NULL,  
  collarProb = 0,  
  codeRestriction = NULL,  
  customCoders = NULL,  
  splitFunction = NULL,  
  ncross = 3,  
  forceSplit = FALSE,  
  catScaling = TRUE,  
  verbose = TRUE,  
  parallelCluster = NULL,  
  use_parallel = TRUE,  
  missingness_imputation = NULL,  
  imputation_map = NULL  
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.
outcometarget	Value/level of outcome to be considered "success", and there must be a cut such that dframe[[outcomename]]==outcometarget at least twice and dframe[[outcomename]]!=outcometarget at least twice.
...	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan .
codeRestriction	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders.md).
splitFunction	(optional) see vtreat::buildEvalSets .
ncross	optional scalar >=2 number of cross validation splits use in rescoring complex variables.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.
verbose	if TRUE print progress.
parallelCluster	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods (when parallel cluster is set).
missingness_imputation	function of signature f(values: numeric, weights: numeric), simple missing value imputer.
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

The main fields are mostly vectors with names (all with the same names in the same order):

- vars : (character array without names) names of variables (in same order as names on the other diagnostic vectors) - varMoves : logical TRUE if the variable varied during hold out scoring, only variables that move will be in the treated frame - #' - sig : an estimate significance of effect

See the vtreat vignette for a bit more detail and a worked example.

Columns that do not vary are not passed through.

Note: re-encoding high cardinality on training data can introduce nested model bias, consider using `mkCrossFrameCExperiment` instead.

Value

treatment plan (for use with `prepare`)

See Also

[prepare.treatmentplan](#), [designTreatmentsN](#), [designTreatmentsZ](#), [mkCrossFrameCExperiment](#)

Examples

```
dTrainC <- data.frame(x=c('a','a','a','b','b','b'),
  z=c(1,2,3,4,5,6),
  y=c(FALSE,FALSE,TRUE,FALSE,TRUE,TRUE))
dTestC <- data.frame(x=c('a','b','c',NA),
  z=c(10,20,30,NA))
treatmentsC <- designTreatmentsC(dTrainC,colnames(dTrainC),'y',TRUE)
dTestCTreated <- prepare(treatmentsC,dTestC,pruneSig=0.99)
```

`designTreatmentsN` *build all treatments for a data frame to predict a numeric outcome*

Description

Function to design variable treatments for binary prediction of a numeric outcome. Data frame is assumed to have only atomic columns except for dates (which are converted to numeric). Note: each column is processed independently of all others. Note: re-encoding high cardinality on training data categorical variables can introduce undesirable nested model bias, for such data consider using [mkCrossFrameNExperiment](#).

Usage

```
designTreatmentsN(
  dframe,
  varlist,
  outcomename,
```

```

    ...,
    weights = c(),
    minFraction = 0.02,
    smFactor = 0,
    rareCount = 0,
    rareSig = NULL,
    collarProb = 0,
    codeRestriction = NULL,
    customCoders = NULL,
    splitFunction = NULL,
    ncross = 3,
    forceSplit = FALSE,
    verbose = TRUE,
    parallelCluster = NULL,
    use_parallel = TRUE,
    missingness_imputation = NULL,
    imputation_map = NULL
  )

```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. <code>dframe[[outcomename]]</code> must be only finite non-missing values and there must be a cut such that <code>dframe[[outcomename]]</code> is both above the cut at least twice and below the cut at least twice.
...	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if <code>doCollar</code> is set during <code>prepare.treatmentplan</code> .
codeRestriction	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders.md).
splitFunction	(optional) see <code>vtreat::buildEvalSets</code> .

ncross	optional scalar ≥ 2 number of cross validation splits use in rescoring complex variables.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
verbose	if TRUE print progress.
parallelCluster	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods (when parallel cluster is set).
missingness_imputation	function of signature $f(\text{values: numeric, weights: numeric})$, simple missing value imputer.
imputation_map	map from column names to functions of signature $f(\text{values: numeric, weights: numeric})$, simple missing value imputers.

Details

The main fields are mostly vectors with names (all with the same names in the same order):

- vars : (character array without names) names of variables (in same order as names on the other diagnostic vectors) - varMoves : logical TRUE if the variable varied during hold out scoring, only variables that move will be in the treated frame - sig : an estimate significance of effect

See the vtreat vignette for a bit more detail and a worked example.

Columns that do not vary are not passed through.

Value

treatment plan (for use with prepare)

See Also

[prepare.treatmentplan](#), [designTreatmentsC](#), [designTreatmentsZ](#), [mkCrossFrameNExperiment](#)

Examples

```
dTrainN <- data.frame(x=c('a', 'a', 'a', 'a', 'b', 'b', 'b'),
  z=c(1,2,3,4,5,6,7),y=c(0,0,0,1,0,1,1))
dTestN <- data.frame(x=c('a', 'b', 'c', NA),
  z=c(10,20,30,NA))
treatmentsN = designTreatmentsN(dTrainN,colnames(dTrainN),'y')
dTestNTreated <- prepare(treatmentsN,dTestN,pruneSig=0.99)
```

designTreatmentsZ *Design variable treatments with no outcome variable.*

Description

Data frame is assumed to have only atomic columns except for dates (which are converted to numeric). Note: each column is processed independently of all others.

Usage

```
designTreatmentsZ(
  dframe,
  varlist,
  ...,
  minFraction = 0,
  weights = c(),
  rareCount = 0,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  verbose = TRUE,
  parallelCluster = NULL,
  use_parallel = TRUE,
  missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
...	no additional arguments, declared to forced named binding of later arguments
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
weights	optional training weights for each row
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during prepare.treatmentplan .
codeRestriction	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders.md).

verbose if TRUE print progress.
parallelCluster (optional) a cluster object created by package parallel or package snow.
use_parallel logical, if TRUE use parallel methods (if parallel cluster is set).
missingness_imputation function of signature f(values: numeric, weights: numeric), simple missing value imputer.
imputation_map map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

The main fields are mostly vectors with names (all with the same names in the same order):

- vars : (character array without names) names of variables (in same order as names on the other diagnostic vectors) - varMoves : logical TRUE if the variable varied during hold out scoring, only variables that move will be in the treated frame

See the vtreat vignette for a bit more detail and a worked example.

Columns that do not vary are not passed through.

Value

treatment plan (for use with prepare)

See Also

[prepare.treatmentplan](#), [designTreatmentsC](#), [designTreatmentsN](#)

Examples

```

dTrainZ <- data.frame(x=c('a','a','a','a','b','b',NA,'e','e'),
  z=c(1,2,3,4,5,6,7,NA,9))
dTestZ <- data.frame(x=c('a','x','c',NA),
  z=c(10,20,30,NA))
treatmentsZ = designTreatmentsZ(dTrainZ, colnames(dTrainZ),
  rareCount=0)
dTrainZTreated <- prepare(treatmentsZ, dTrainZ)
dTestZTreated <- prepare(treatmentsZ, dTestZ)
  
```

design_missingness_treatment

Design a simple treatment plan to indicate missingness and perform simple imputation.

Description

Design a simple treatment plan to indicate missingness and perform simple imputation.

Usage

```
design_missingness_treatment(
  dframe,
  ...,
  varlist = colnames(dframe),
  invalid_mark = "_invalid_",
  drop_constant_columns = FALSE,
  missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

`dframe` data.frame to drive design.

`...` not used, forces later arguments to bind by name.

`varlist` character, names of columns to process.

`invalid_mark` character, name to use for NA levels and novel levels.

`drop_constant_columns` logical, if TRUE drop columns that do not vary from the treatment plan.

`missingness_imputation` function of signature `f(values: numeric)`, simple missing value imputer.

`imputation_map` map from column names to functions of signature `f(values: numeric)`, simple missing value imputers.

Value

simple treatment plan.

See Also

[prepare.simple_plan](#)

Examples

```
d <- wrapr::build_frame(
  "x1", "x2", "x3" |
  1 , 4 , "A" |
  NA , 5 , "B" |
  3 , 6 , NA )

plan <- design_missingness_treatment(d)
prepare(plan, d)

prepare(plan, data.frame(x1=NA, x2=NA, x3="E"))
```

fit	<i>Fit first argument to data in second argument.</i>
-----	---

Description

Update the state of first argument to have learned or fit from second argument.

Usage

```
fit(vps, dframe, ..., weights = NULL, parallelCluster = NULL)
```

Arguments

vps	vtreat pipe step, object specifying fit
dframe	data.frame, data to fit from.
...	not used, forces later arguments to bind by name.
weights	optional, per-dframe data weights.
parallelCluster	optional, parallel cluster to run on.

Details

Note: input vps is not altered, fit is in returned value.

Value

new fit object

fit_prepare	<i>Fit and prepare in a cross-validated manner.</i>
-------------	---

Description

Update the state of first argument to have learned or fit from second argument, and compute a cross validated example of such a transform.

Usage

```
fit_prepare(vps, dframe, ..., weights = NULL, parallelCluster = NULL)
```

Arguments

vps	vtreat pipe step, object specifying fit.
dframe	data.frame, data to fit from.
...	not used, forces later arguments to bind by name.
weights	optional, per-dframe data weights.
parallelCluster	optional, parallel cluster to run on.

Details

Note: input vps is not altered, fit is in returned list.

Value

@return named list containing: treatments and cross_frame

fit_transform	<i>Fit and transform in a cross-validated manner.</i>
---------------	---

Description

Update the state of first argument to have learned or fit from second argument, and compute a cross validated example of such a transform.

Usage

```
fit_transform(vps, dframe, ..., weights = NULL, parallelCluster = NULL)
```

Arguments

vps	vtreat pipe step, object specifying fit.
dframe	data.frame, data to fit from.
...	not used, forces later arguments to bind by name.
weights	optional, per-dframe data weights.
parallelCluster	optional, parallel cluster to run on.

Details

Note: input vps is not altered, fit is in returned list.

Value

@return named list containing: treatments and cross_frame

`format.vtreatment` *Display treatment plan.*

Description

Display treatment plan.

Usage

```
## S3 method for class 'vtreatment'  
format(x, ...)
```

Arguments

`x` treatment plan
`...` additional args (to match general signature).

`getSplitPlanAppLabels` *read application labels off a split plan.*

Description

read application labels off a split plan.

Usage

```
getSplitPlanAppLabels(nRow, plan)
```

Arguments

`nRow` number of rows in original data.frame.
`plan` split plan

Value

vector of labels

See Also

[kWayCrossValidation](#), [kWayStratifiedY](#), and [makekWayCrossValidationGroupedByColumn](#)

Examples

```
plan <- kWayStratifiedY(3,2,NULL,NULL)  
getSplitPlanAppLabels(3,plan)
```

get_feature_names *Return feasible feature names.*

Description

Return previously fit feature names.

Usage

`get_feature_names(vps)`

Arguments

`vps` vtreat pipe step, mutable object to read from.

Value

feature names

get_score_frame *Return score frame from vps.*

Description

Return previously fit score frame.

Usage

`get_score_frame(vps)`

Arguments

`vps` vtreat pipe step, mutable object to read from.

Value

score frame

get_transform	<i>Return underlying transform from vps.</i>
---------------	--

Description

Return previously fit transform.

Usage

```
get_transform(vps)
```

Arguments

vps	vtreat pipe step, mutable object to read from.
-----	--

Value

transform

kWayCrossValidation	<i>k-fold cross validation, a splitFunction in the sense of vtreat::buildEvalSets</i>
---------------------	---

Description

k-fold cross validation, a splitFunction in the sense of vtreat::buildEvalSets

Usage

```
kWayCrossValidation(nRows, nSplits, dframe, y)
```

Arguments

nRows	number of rows to split (>1).
nSplits	number of groups to split into (>1,<=nRows).
dframe	original data frame (ignored).
y	numeric outcome variable (ignored).

Value

split plan

Examples

```
kWayCrossValidation(7,2,NULL,NULL)
```

kWayStratifiedY	<i>k-fold cross validation stratified on y, a splitFunction in the sense of vtreat::buildEvalSets</i>
-----------------	---

Description

k-fold cross validation stratified on y, a splitFunction in the sense of vtreat::buildEvalSets

Usage

```
kWayStratifiedY(nRows, nSplits, dframe, y)
```

Arguments

nRows	number of rows to split (>1)
nSplits	number of groups to split into (<nRows,>1).
dframe	original data frame (ignored).
y	numeric outcome variable try to have equidistributed in each split.

Value

split plan

Examples

```
set.seed(23255)
d <- data.frame(y=sin(1:100))
pStrat <- kWayStratifiedY(nrow(d),5,d,d$y)
problemAppPlan(nrow(d),5,pStrat,TRUE)
d$stratGroup <- vtreat::getSplitPlanAppLabels(nrow(d),pStrat)
pSimple <- kWayCrossValidation(nrow(d),5,d,d$y)
problemAppPlan(nrow(d),5,pSimple,TRUE)
d$simpleGroup <- vtreat::getSplitPlanAppLabels(nrow(d),pSimple)
summary(tapply(d$y,d$simpleGroup,mean))
summary(tapply(d$y,d$stratGroup,mean))
```

kWayStratifiedYReplace

k-fold cross validation stratified with replacement on y, a splitFunction in the sense of vtreat::buildEvalSets .

Description

Build a k-fold cross validation sample where training sets are the same size as the original data, and built by sampling disjoint from test/application sets (sampled with replacement).

Usage

```
kWayStratifiedYReplace(nRows, nSplits, dframe, y)
```

Arguments

nRows	number of rows to split (>1)
nSplits	number of groups to split into (<nRows,>1).
dframe	original data frame (ignored).
y	numeric outcome variable try to have equidistributed in each split.

Value

split plan

Examples

```
set.seed(23255)
d <- data.frame(y=sin(1:100))
pStrat <- kWayStratifiedYReplace(nrow(d),5,d,d$y)
```

makeCustomCoderCat *Make a categorical input custom coder.*

Description

Make a categorical input custom coder.

Usage

```

makeCustomCoderCat(
  ...,
  customCode,
  coder,
  codeSeq,
  v,
  vcolin,
  zoY,
  zC,
  zTarget,
  weights = NULL,
  catScaling = FALSE
)

```

Arguments

...	not used, force arguments to be set by name
customCode	code name
coder	user supplied variable re-coder (see vignette for type signature)
codeSeq	arguments to custom coder
v	variable name
vcolin	data column, character
zoY	outcome column as numeric
zC	if classification outcome column as character
zTarget	if classification target class
weights	per-row weights
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.

Value

wrapped custom coder

makeCustomCoderNum *Make a numeric input custom coder.*

Description

Make a numeric input custom coder.

Usage

```
makeCustomCoderNum(
  ...,
  customCode,
  coder,
  codeSeq,
  v,
  vcolin,
  zoY,
  zC,
  zTarget,
  weights = NULL,
  catScaling = FALSE
)
```

Arguments

...	not used, force arguments to be set by name
customCode	code name
coder	user supplied variable re-coder (see vignette for type signature)
codeSeq	arguments to custom coder
v	variable name
vcolin	data column, numeric
zoY	outcome column as numeric
zC	if classification outcome column as character
zTarget	if classification target class
weights	per-row weights
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.

Value

wrapped custom coder

makekWayCrossValidationGroupedByColumn

Build a k-fold cross validation splitter, respecting (never splitting) groupingColumn.

Description

Build a k-fold cross validation splitter, respecting (never splitting) groupingColumn.

Usage

```
makekWayCrossValidationGroupedByColumn(groupingColumnName)
```

Arguments

groupingColumnName
name of column to group by.

Value

splitting function in the sense of vtreat::buildEvalSets.

Examples

```
d <- data.frame(y=sin(1:100))
d$group <- floor(seq_len(nrow(d))/5)
splitter <- makekWayCrossValidationGroupedByColumn('group')
split <- splitter(nrow(d),5,d,d$y)
d$splitLabel <- vtreat::getSplitPlanAppLabels(nrow(d),split)
rowSums(table(d$group,d$splitLabel)>0)
```

mkCrossFrameCExperiment

Run categorical cross-frame experiment.

Description

Builds a [designTreatmentsC](#) treatment plan and a data frame prepared from dframe that is "cross" in the sense each row is treated using a treatment plan built from a subset of dframe disjoint from the given row. The goal is to try to and supply a method of breaking nested model bias other than splitting into calibration, training, test sets.

Usage

```
mkCrossFrameCExperiment(  
  dframe,  
  varlist,  
  outcomename,  
  outcometarget,  
  ...,  
  weights = c(),  
  minFraction = 0.02,  
  smFactor = 0,  
  rareCount = 0,  
  rareSig = 1,  
  collarProb = 0,  
  codeRestriction = NULL,  
  customCoders = NULL,  
  scale = FALSE,  
  doCollar = FALSE,
```

```

splitFunction = NULL,
ncross = 3,
forceSplit = FALSE,
catScaling = TRUE,
verbose = TRUE,
parallelCluster = NULL,
use_parallel = TRUE,
missingness_imputation = NULL,
imputation_map = NULL
)

```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. <code>dframe[[outcomename]]</code> must be only finite non-missing values.
outcometarget	Value/level of outcome to be considered "success", and there must be a cut such that <code>dframe[[outcomename]]==outcometarget</code> at least twice and <code>dframe[[outcomename]]!=outcometarget</code> at least twice.
...	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if <code>doCollar</code> is set during <code>prepare.treatmentplan</code> .
codeRestriction	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders.md).
scale	optional if TRUE replace numeric variables with regression ("move to outcome-scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by <code>collarProb</code> during treatment design.
splitFunction	(optional) see <code>vtreat::buildEvalSets</code> .
ncross	optional scalar ≥ 2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.

catScaling optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.
 verbose if TRUE print progress.
 parallelCluster
 (optional) a cluster object created by package parallel or package snow.
 use_parallel logical, if TRUE use parallel methods.
 missingness_imputation
 function of signature f(values: numeric, weights: numeric), simple missing
 value imputer.
 imputation_map map from column names to functions of signature f(values: numeric, weights:
 numeric), simple missing value imputers.

Value

named list containing: treatments, crossFrame, crossWeights, method, and evalSets

  print(.)

# Any future application data is prepared with
# the prepare method.
dTestCTreated <- prepare(treatmentsC, dTestC, pruneSig=NULL)

dTestCTreated %.>%
  head(.) %.>%
  print(.)

```

mkCrossFrameMExperiment

Function to build multi-outcome vtreat cross frame and treatment plan.

Description

Please see vignette("MultiClassVtreat", package = "vtreat") <https://winvector.github.io/vtreat/articles/MultiClassVtreat.html>.

Usage

```

mkCrossFrameMExperiment(
  dframe,
  varlist,
  outcomename,
  ...,
  weights = c(),
  minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = vtreat::kWayCrossValidation,
  ncross = 3,

```

```

    forceSplit = FALSE,
    catScaling = FALSE,
    y_dependent_treatments = c("catB"),
    verbose = FALSE,
    parallelCluster = NULL,
    use_parallel = TRUE,
    missingness_imputation = NULL,
    imputation_map = NULL
  )

```

Arguments

dframe	data to learn from
varlist	character, vector of independent variable column names.
outcomename	character, name of outcome column.
...	not used, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during <code>prepare.multinomial_plan</code> .
codeRestriction	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders.md).
scale	optional if TRUE replace numeric variables with regression ("move to outcome-scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
splitFunction	(optional) see <code>vtreat::buildEvalSets</code> .
ncross	optional scalar ≥ 2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
catScaling	optional, if TRUE use <code>glm()</code> linkspace, if FALSE use <code>lm()</code> for scaling.
y_dependent_treatments	character what treatment types to build per-outcome level.
verbose	if TRUE print progress.

parallelCluster (optional) a cluster object created by package parallel or package snow.

use_parallel logical, if TRUE use parallel methods.

missingness_imputation function of signature f(values: numeric, weights: numeric), simple missing value imputer.

imputation_map map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Value

a names list containing cross_frame, treat_m, score_frame, and fit_obj_id

See Also

dTestMTreated %.>%
  head(.) %.>%
  print(.)

```

mkCrossFrameNExperiment

Run a numeric cross frame experiment.

Description

Builds a [designTreatmentsN](#) treatment plan and a data frame prepared from `dframe` that is "cross" in the sense each row is treated using a treatment plan built from a subset of `dframe` disjoint from the given row. The goal is to try to and supply a method of breaking nested model bias other than splitting into calibration, training, test sets.

Usage

```

mkCrossFrameNExperiment(
  dframe,
  varlist,
  outcomename,
  ...,
  weights = c(),
  minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  codeRestriction = NULL,
  customCoders = NULL,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,

```

```

    verbose = TRUE,
    parallelCluster = NULL,
    use_parallel = TRUE,
    missingness_imputation = NULL,
    imputation_map = NULL
  )

```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. <code>dframe[[outcomename]]</code> must be only finite non-missing values and there must be a cut such that <code>dframe[[outcomename]]</code> is both above the cut at least twice and below the cut at least twice.
...	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if <code>doCollar</code> is set during <code>prepare.treatmentplan</code> .
codeRestriction	what types of variables to produce (character array of level codes, NULL means no restriction).
customCoders	map from code names to custom categorical variable encoding functions (please see https://github.com/WinVector/vtreat/blob/main/extras/CustomLevelCoders.md).
scale	optional if TRUE replace numeric variables with regression ("move to outcome-scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by <code>collarProb</code> during treatment design.
splitFunction	(optional) see <code>vtreat::buildEvalSets</code> .
ncross	optional scalar ≥ 2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
verbose	if TRUE print progress.
parallelCluster	(optional) a cluster object created by package <code>parallel</code> or package <code>snow</code> .
use_parallel	logical, if TRUE use parallel methods.

missingness_imputation
 function of signature f(values: numeric, weights: numeric), simple missing value imputer.

imputation_map map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Value

named list containing: treatments, crossFrame, crossWeights, method, and evalSets

  head(.) %.>%
  print(.)

```

MultinomialOutcomeTreatment

Stateful object for designing and applying multinomial outcome treatments.

Description

Hold settings and results for multinomial classification data preparation.

Usage

```

MultinomialOutcomeTreatment(
  ...,
  var_list,
  outcome_name,
  cols_to_copy = NULL,
  params = NULL,
  imputation_map = NULL
)

```

Arguments

...	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
outcome_name	Name of column holding outcome variable. <code>dframe[[outcomename]]</code> must be only finite non-missing values.
cols_to_copy	list of extra columns to copy.
params	parameters list from <code>multinomial_parameters</code>
imputation_map	map from column names to functions of signature <code>f(values: numeric, weights: numeric)</code> , simple missing value imputers.

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [mkCrossFrameMExperiment](#) and [prepare.multinomial_plan](#) for details.

Note: there currently is no designTreatmentsM, so MultinomialOutcomeTreatment\$fit() is implemented in terms of MultinomialOutcomeTreatment\$fit_transform()

multinomial_parameters

vtreat multinomial parameters.

Description

A list of settings and values for vtreat multinomial classification fitting. Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [mkCrossFrameMExperiment](#) and [prepare.multinomial_plan](#) for details.

Usage

```
multinomial_parameters(user_params = NULL)
```

Arguments

user_params list of user overrides.

Value

filled out parameter list

novel_value_summary

Report new/novel appearances of character values.

Description

Report new/novel appearances of character values.

Usage

```
novel_value_summary(dframe, trackedValues)
```

Arguments

dframe Data frame to inspect.

trackedValues optional named list mapping variables to know values, allows warnings upon novel level appearances (see [track_values](#))

Value

frame of novel occurrences

See Also

[prepare.treatmentplan](#), [track_values](#)

Examples

```
set.seed(23525)
zip <- c(NA, paste('z', 1:10, sep = "_"))
N <- 10
d <- data.frame(zip = sample(zip, N, replace=TRUE),
                zip2 = sample(zip, N, replace=TRUE),
                y = runif(N))
dSample <- d[1:5, , drop = FALSE]
trackedValues <- track_values(dSample, c("zip", "zip2"))
novel_value_summary(d, trackedValues)
```

NumericOutcomeTreatment

Stateful object for designing and applying numeric outcome treatments.

Description

Hold settings and results for regression data preparation.

Usage

```
NumericOutcomeTreatment(
  ...,
  var_list,
  outcome_name,
  cols_to_copy = NULL,
  params = NULL,
  imputation_map = NULL
)
```

Arguments

...	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
outcome_name	Name of column holding outcome variable. <code>dframe[[outcome_name]]</code> must be only finite non-missing values.
cols_to_copy	list of extra columns to copy.

params parameters list from regression_parameters

imputation_map map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [mkCrossFrameNExperiment](#), [designTreatmentsN](#), and [prepare.treatmentplan](#) for details.

oneWayHoldout *One way holdout, a splitFunction in the sense of vtreat::buildEvalSets.*

Description

Note one way holdout can leak target expected values, so it should not be preferred in nested modeling situations. Also, doesn't respect nSplits.

Usage

```
oneWayHoldout(nRows, nSplits, dframe, y)
```

Arguments

nRows number of rows to split (integer >1).

nSplits number of groups to split into (ignored).

dframe original data frame (ignored).

y numeric outcome variable (ignored).

Value

split plan

Examples

```
oneWayHoldout(3, NULL, NULL, NULL)
```

```
patch_columns_into_frame
```

Patch columns into data.frame.

Description

Add columns from `new_frame` into `old_frame`, replacing any columns with matching names in `orig_frame` with values from `new_frame`.

Usage

```
patch_columns_into_frame(orig_frame, new_frame)
```

Arguments

<code>orig_frame</code>	data.frame to patch into.
<code>new_frame</code>	data.frame to take replacement columns from.

Value

patched data.frame

Examples

```
orig_frame <- data.frame(x = 1, y = 2)
new_frame <- data.frame(y = 3, z = 4)
patch_columns_into_frame(orig_frame, new_frame)
```

```
prepare
```

Apply treatments and restrict to useful variables.

Description

Apply treatments and restrict to useful variables.

Usage

```
prepare(treatmentplan, dframe, ...)
```

Arguments

<code>treatmentplan</code>	Plan built by <code>designTreatmentsC()</code> or <code>designTreatmentsN()</code>
<code>dframe</code>	Data frame to be treated
<code>...</code>	no additional arguments, declared to forced named binding of later arguments

See Also

[prepare.treatmentplan](#), [prepare.simple_plan](#), [prepare.multinomial_plan](#)

```
prepare.multinomial_plan
```

Function to apply mkCrossFrameMExperiment treatemnts.

Description

Please see vignette("MultiClassVtreat", package = "vtreat") <https://winvector.github.io/vtreat/articles/MultiClassVtreat.html>.

Usage

```
## S3 method for class 'multinomial_plan'
prepare(
  treatmentplan,
  dframe,
  ...,
  pruneSig = NULL,
  scale = FALSE,
  doCollar = FALSE,
  varRestriction = NULL,
  codeRestriction = NULL,
  trackedValues = NULL,
  extracols = NULL,
  parallelCluster = NULL,
  use_parallel = TRUE,
  check_for_duplicate_frames = TRUE
)
```

Arguments

treatmentplan	multinomial_plan from mkCrossFrameMExperiment.
dframe	new data to process.
...	not used, declared to forced named binding of later arguments
pruneSig	suppress variables with significance above this level
scale	optional if TRUE replace numeric variables with single variable model regressions ("move to outcome-scale"). These have mean zero and (for variables with significant less than 1) slope 1 when regressed (lm for regression problems/glm for classification problems) against outcome.
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
varRestriction	optional list of treated variable names to restrict to

codeRestriction	optional list of treated variable codes to restrict to
trackedValues	optional named list mapping variables to know values, allows warnings upon novel level appearances (see track_values)
extracols	extra columns to copy.
parallelCluster	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods.
check_for_duplicate_frames	logical, if TRUE check if we called prepare on same data.frame as design step.

Value

prepared data frame.

See Also

[mkCrossFrameMExperiment](#), [prepare](#)

prepare.simple_plan *Prepare a simple treatment.*

Description

Prepare a simple treatment.

Usage

```
## S3 method for class 'simple_plan'
prepare(treatmentplan, dframe, ...)
```

Arguments

treatmentplan	A simple treatment plan.
dframe	data.frame to be treated.
...	not used, present for S3 signature consistency.

See Also

[design_missingness_treatment](#), [prepare](#)

Examples

```
d <- wrapr::build_frame(
  "x1", "x2", "x3" |
  1 , 4 , "A" |
  NA , 5 , "B" |
  3 , 6 , NA )

plan <- design_missingness_treatment(d)
prepare(plan, d)

prepare(plan, data.frame(x1=NA, x2=NA, x3="E"))
```

prepare.treatmentplan *Apply treatments and restrict to useful variables.*

Description

Use a treatment plan to prepare a data frame for analysis. The resulting frame will have new effective variables that are numeric and free of NaN/NA. If the outcome column is present it will be copied over. The intent is that these frames are compatible with more machine learning techniques, and avoid a lot of corner cases (NA,NaN, novel levels, too many levels). Note: each column is processed independently of all others. Also copies over outcome if present. Note: treatmentplan's are not meant for long-term storage, a warning is issued if the version of vtreat that produced the plan differs from the version running prepare().

Usage

```
## S3 method for class 'treatmentplan'
prepare(
  treatmentplan,
  dframe,
  ...,
  pruneSig = NULL,
  scale = FALSE,
  doCollar = FALSE,
  varRestriction = NULL,
  codeRestriction = NULL,
  trackedValues = NULL,
  extracols = NULL,
  parallelCluster = NULL,
  use_parallel = TRUE,
  check_for_duplicate_frames = TRUE
)
```

Arguments

<code>treatmentplan</code>	Plan built by <code>designTreatmentsC()</code> or <code>designTreatmentsN()</code>
<code>dframe</code>	Data frame to be treated
<code>...</code>	no additional arguments, declared to forced named binding of later arguments
<code>pruneSig</code>	suppress variables with significance above this level
<code>scale</code>	optional if TRUE replace numeric variables with single variable model regressions ("move to outcome-scale"). These have mean zero and (for variables with significant less than 1) slope 1 when regressed (lm for regression problems/glm for classification problems) against outcome.
<code>doCollar</code>	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by <code>collarProb</code> during treatment design.
<code>varRestriction</code>	optional list of treated variable names to restrict to
<code>codeRestriction</code>	optional list of treated variable codes to restrict to
<code>trackedValues</code>	optional named list mapping variables to know values, allows warnings upon novel level appearances (see track_values)
<code>extracols</code>	extra columns to copy.
<code>parallelCluster</code>	(optional) a cluster object created by package <code>parallel</code> or package <code>snow</code> .
<code>use_parallel</code>	logical, if TRUE use parallel methods.
<code>check_for_duplicate_frames</code>	logical, if TRUE check if we called <code>prepare</code> on same data.frame as design step.

Value

treated data frame (all columns numeric- without NA, NaN)

See Also

[mkCrossFrameCExperiment](#), [mkCrossFrameNExperiment](#), [designTreatmentsC](#) [designTreatmentsN](#) [designTreatmentsZ](#), [prepare](#)

Examples

```
# categorical example
set.seed(23525)

# we set up our raw training and application data
dTrainC <- data.frame(
  x = c('a', 'a', 'a', 'b', 'b', NA, NA),
  z = c(1, 2, 3, 4, NA, 6, NA),
  y = c(FALSE, FALSE, TRUE, FALSE, TRUE, TRUE, TRUE))

dTestC <- data.frame(
  x = c('a', 'b', 'c', NA),
  z = c(10, 20, 30, NA))
```

```

# we perform a vtreat cross frame experiment
# and unpack the results into treatmentsC
# and dTrainCTreated
unpack[
  treatmentsC = treatments,
  dTrainCTreated = crossFrame
] <- mkCrossFrameCExperiment(
  dframe = dTrainC,
  varlist = setdiff(colnames(dTrainC), 'y'),
  outcomename = 'y',
  outcometarget = TRUE,
  verbose = FALSE)

# the treatments include a score frame relating new
# derived variables to original columns
treatmentsC$scoreFrame[, c('origName', 'varName', 'code', 'rsq', 'sig', 'extraModelDegrees')] %>%
  print(.)

# the treated frame is a "cross frame" which
# is a transform of the training data built
# as if the treatment were learned on a different
# disjoint training set to avoid nested model
# bias and over-fit.
dTrainCTreated %>%
  head(.) %>%
  print(.)

# Any future application data is prepared with
# the prepare method.
dTestCTreated <- prepare(treatmentsC, dTestC, pruneSig=NULL)

dTestCTreated %>%
  head(.) %>%
  print(.)

```

pre_comp_xval

Pre-computed cross-plan (so same split happens each time).

Description

Pre-computed cross-plan (so same split happens each time).

Usage

```
pre_comp_xval(nRows, nSplits, splitplan)
```

Arguments

nRows	number of rows to split (integer >1).
nSplits	number of groups to split into (ignored).
splitplan	split plan to actually use

Value

splitplan

Examples

```
p1 <- oneWayHoldout(3,NULL,NULL,NULL)
p2 <- pre_comp_xval(3, 3, p1)
p2(3, 3)
```

```
print.multinomial_plan
```

Print treatmentplan.

Description

Print treatmentplan.

Usage

```
## S3 method for class 'multinomial_plan'
print(x, ...)
```

Arguments

x	treatmentplan
...	additional args (to match general signature).

`print.simple_plan` *Print treatmentplan.*

Description

Print treatmentplan.

Usage

```
## S3 method for class 'simple_plan'  
print(x, ...)
```

Arguments

x treatmentplan
... additional args (to match general signature).

`print.treatmentplan` *Print treatmentplan.*

Description

Print treatmentplan.

Usage

```
## S3 method for class 'treatmentplan'  
print(x, ...)
```

Arguments

x treatmentplan
... additional args (to match general signature).

See Also

[designTreatmentsC](#), [designTreatmentsN](#), [designTreatmentsZ](#), [prepare.treatmentplan](#)

print.vtreatment	<i>Print treatmentplan.</i>
------------------	-----------------------------

Description

Print treatmentplan.

Usage

```
## S3 method for class 'vtreatment'
print(x, ...)
```

Arguments

x	treatmentplan
...	additional args (to match general signature).

See Also

[designTreatmentsC](#), [designTreatmentsN](#), [designTreatmentsZ](#), [prepare.treatmentplan](#)

problemAppPlan	<i>check if appPlan is a good carve-up of 1:nRows into nSplits groups</i>
----------------	---

Description

check if appPlan is a good carve-up of 1:nRows into nSplits groups

Usage

```
problemAppPlan(nRows, nSplits, appPlan, strictCheck)
```

Arguments

nRows	number of rows to carve-up
nSplits	number of sets to carve-up into
appPlan	carve-up to critique
strictCheck	logical, if true expect application data to be a carve-up and training data to be a maximal partition and to match nSplits.

Value

problem with carve-up (null if good)

See Also

[kWayCrossValidation](#), [kWayStratifiedY](#), and [makekWayCrossValidationGroupedByColumn](#)

Examples

```
plan <- kWayStratifiedY(3,2,NULL,NULL)
problemAppPlan(3,3,plan,TRUE)
```

regression_parameters *vtreat regression parameters.*

Description

A list of settings and values for vtreat regression fitting. Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [mkCrossFrameCExperiment](#), [designTreatmentsC](#), and [mkCrossFrameNExperiment](#), [designTreatmentsN](#), [prepare.treatmentplan](#) for details.

Usage

```
regression_parameters(user_params = NULL)
```

Arguments

user_params list of user overrides.

Value

filled out parameter list

rquery_prepare *Materialize a treated data frame remotely.*

Description

Materialize a treated data frame remotely.

Usage

```
rquery_prepare(
  db,
  rqplan,
  data_source,
  result_table_name,
  ...,
  extracols = NULL,
  temporary = FALSE,
  overwrite = TRUE,
  attempt_nan_inf_mapping = FALSE,
  col_sample = NULL,
  return_ops = FALSE
)
```

```
materialize_treated(
  db,
  rqplan,
  data_source,
  result_table_name,
  ...,
  extracols = NULL,
  temporary = FALSE,
  overwrite = TRUE,
  attempt_nan_inf_mapping = FALSE,
  col_sample = NULL,
  return_ops = FALSE
)
```

Arguments

<code>db</code>	a db handle.
<code>rqplan</code>	an query plan produced by <code>as_rquery_plan()</code> .
<code>data_source</code>	relop, data source (usually a <code>relop_table_source</code>).
<code>result_table_name</code>	character, table name to land result in
<code>...</code>	force later arguments to bind by name.
<code>extracols</code>	extra columns to copy.
<code>temporary</code>	logical, if TRUE try to make result temporary.
<code>overwrite</code>	logical, if TRUE try to overwrite result.
<code>attempt_nan_inf_mapping</code>	logical, if TRUE attempt to map NaN and Infinity to NA/NULL (goot on PostgreSQL, not on Spark).
<code>col_sample</code>	sample of data to determine column types.
<code>return_ops</code>	logical, if TRUE return operator tree instead of materializing.

Value

description of treated table.

Functions

- `materialize_treated()`: old name for `rquery_prepare` function

See Also

[as_rquery_plan](#), [rqdatatable_prepare](#)

<code>solve_piecewise</code>	<i>Solve as piecewise linear problem, numeric target.</i>
------------------------------	---

Description

Return a vector of length `y` that is a piecewise function of `x`. This vector is picked as close to `y` (by square-distance) as possible for a set of `x`-only determined cut-points. Cross-validates for a good number of segments.

Usage

```
solve_piecewise(varName, x, y, w = NULL)
```

Arguments

<code>varName</code>	character, name of variable
<code>x</code>	numeric input (not empty, no NAs).
<code>y</code>	numeric or castable to such (same length as <code>x</code> no NAs), output to match
<code>w</code>	numeric positive, same length as <code>x</code> (weights, can be NULL)

Value

segmented `y` prediction

solve_piecewisec	<i>Solve as piecewise logit problem, categorical target.</i>
------------------	--

Description

Return a vector of length y that is a piecewise function of x. This vector is picked as close to y (by square-distance) as possible for a set of x-only determined cut-points. Cross-validates for a good number of segments.

Usage

```
solve_piecewisec(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
y	numeric or castable to such (same length as x no NAs), output to match
w	numeric positive, same length as x (weights, can be NULL)

Value

segmented y prediction

spline_variable	<i>Spline variable numeric target.</i>
-----------------	--

Description

Return a spline approximation of data.

Usage

```
spline_variable(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
y	numeric or castable to such (same length as x no NAs), output to match
w	numeric positive, same length as x (weights, can be NULL)

Value

spline y prediction

spline_variablec	<i>Spline variable categorical target.</i>
------------------	--

Description

Return a spline approximation of the change in log odds.

Usage

```
spline_variablec(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
y	numeric or castable to such (same length as x no NAs), output to match
w	numeric positive, same length as x (weights, can be NULL)

Value

spline y prediction

square_window	<i>Build a square windows variable, numeric target.</i>
---------------	---

Description

Build a square moving average window (KNN in 1d). This is a high-frequency feature.

Usage

```
square_window(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
y	numeric or castable to such (same length as x no NAs), output to match
w	numeric positive, same length as x (weights, can be NULL) IGNORED

Value

segmented y prediction

Examples

```
d <- data.frame(x = c(NA, 1:6), y = c(0, 0, 0, 1, 1, 0, 0))
square_window("v", d$x, d$y)
```

square_windowc	<i>Build a square windows variable, categorical target.</i>
----------------	---

Description

Build a square moving average window (KNN in 1d). This is a high-frequency feature. Approximation of the change in log odds.

Usage

```
square_windowc(varName, x, y, w = NULL)
```

Arguments

varName	character, name of variable
x	numeric input (not empty, no NAs).
y	numeric or castable to such (same length as x no NAs), output to match
w	numeric positive, same length as x (weights, can be NULL) IGNORED

Value

segmented y prediction

Examples

```
d <- data.frame(x = c(NA, 1:6), y = c(0, 0, 0, 1, 1, 0, 0))
square_window("v", d$x, d$y)
```

track_values	<i>Track unique character values for variables.</i>
--------------	---

Description

Builds lists of observed unique character values of varlist variables from the data frame.

Usage

```
track_values(dframe, varlist)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).

Value

named list of values seen.

See Also

[prepare.treatmentplan](#), [novel_value_summary](#)

Examples

```
set.seed(23525)
zip <- c(NA, paste('z', 1:100, sep = "_"))
N <- 500
d <- data.frame(zip = sample(zip, N, replace=TRUE),
                zip2 = sample(zip, N, replace=TRUE),
                y = runif(N))
dSample <- d[1:300, , drop = FALSE]
tplan <- designTreatmentsN(dSample,
                          c("zip", "zip2"), "y",
                          verbose = FALSE)
trackedValues <- track_values(dSample, c("zip", "zip2"))
# don't normally want to catch warnings,
# doing it here as this is an example
# and must not have unhandled warnings.
tryCatch(
  prepare(tplan, d, trackedValues = trackedValues),
  warning = function(w) { cat(paste(w, collapse = "\n")) })
```

UnsupervisedTreatment *Stateful object for designing and applying unsupervised treatments.*

Description

Hold settings and results for unsupervised data preparation.

Usage

```
UnsupervisedTreatment(
  ...,
  var_list,
  cols_to_copy = NULL,
  params = NULL,
  imputation_map = NULL
)
```

Arguments

...	not used, force arguments to be specified by name.
var_list	Names of columns to treat (effective variables).
cols_to_copy	list of extra columns to copy.
params	parameters list from unsupervised_parameters
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Details

Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [designTreatmentsZ](#) and [prepare.treatmentplan](#) for details.

Note: for UnsupervisedTreatment `fit_transform(d)` is implemented as `fit(d)$transform(d)`.

unsupervised_parameters
vtreat unsupervised parameters.

Description

A list of settings and values for vtreat unsupervised fitting. Please see https://github.com/WinVector/vtreat/blob/main/Examples/fit_transform/fit_transform_api.md, [designTreatmentsZ](#), and [prepare.treatmentplan](#) for details.

Usage

```
unsupervised_parameters(user_params = NULL)
```

Arguments

user_params list of user overrides.

Value

filled out parameter list

value_variables_C *Value variables for prediction a categorical outcome.*

Description

Value variables for prediction a categorical outcome.

Usage

```
value_variables_C(
  dframe,
  varlist,
  outcomename,
  outcometarget,
  ...,
  weights = c(),
  minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,
  catScaling = TRUE,
  verbose = FALSE,
  parallelCluster = NULL,
  use_parallel = TRUE,
  customCoders = list(c.PiecewiseV.num = vtreat::solve_pieewisec, n.PiecewiseV.num =
    vtreat::solve_piecewise, c.knearest.num = vtreat::square_windowc, n.knearest.num =
    vtreat::square_window),
  codeRestriction = c("PiecewiseV", "knearest", "clean", "isBAD", "catB", "catP"),
  missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values.
outcometarget	Value/level of outcome to be considered "success", and there must be a cut such that dframe[[outcomename]]==outcometarget at least twice and dframe[[outcomename]]!=outcometarget at least twice.
...	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row
minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during <code>prepare.treatmentplan</code> .
scale	optional if TRUE replace numeric variables with regression ("move to outcome-scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
splitFunction	(optional) see vtreat::buildEvalSets .
ncross	optional scalar >= 2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
catScaling	optional, if TRUE use glm() linkspace, if FALSE use lm() for scaling.
verbose	if TRUE print progress.
parallelCluster	(optional) a cluster object created by package parallel or package snow.
use_parallel	logical, if TRUE use parallel methods.
customCoders	additional coders to use for variable importance estimate.
codeRestriction	codes to restrict to for variable importance estimate.
missingness_imputation	function of signature f(values: numeric, weights: numeric), simple missing value imputer.
imputation_map	map from column names to functions of signature f(values: numeric, weights: numeric), simple missing value imputers.

Value

table of variable valuations

value_variables_N	<i>Value variables for prediction a numeric outcome.</i>
-------------------	--

Description

Value variables for prediction a numeric outcome.

Usage

```
value_variables_N(
  dframe,
  varlist,
  outcomename,
  ...,
  weights = c(),
  minFraction = 0.02,
  smFactor = 0,
  rareCount = 0,
  rareSig = 1,
  collarProb = 0,
  scale = FALSE,
  doCollar = FALSE,
  splitFunction = NULL,
  ncross = 3,
  forceSplit = FALSE,
  verbose = FALSE,
  parallelCluster = NULL,
  use_parallel = TRUE,
  customCoders = list(c.PiecewiseV.num = vtreat::solve_pieciwsec, n.PiecewiseV.num =
    vtreat::solve_pieciwise, c.knearest.num = vtreat::square_windowc, n.knearest.num =
    vtreat::square_window),
  codeRestriction = c("PiecewiseV", "knearest", "clean", "isBAD", "catB", "catP"),
  missingness_imputation = NULL,
  imputation_map = NULL
)
```

Arguments

dframe	Data frame to learn treatments from (training data), must have at least 1 row.
varlist	Names of columns to treat (effective variables).
outcomename	Name of column holding outcome variable. dframe[[outcomename]] must be only finite non-missing values and there must be a cut such that dframe[[outcomename]] is both above the cut at least twice and below the cut at least twice.
...	no additional arguments, declared to forced named binding of later arguments
weights	optional training weights for each row

minFraction	optional minimum frequency a categorical level must have to be converted to an indicator column.
smFactor	optional smoothing factor for impact coding models.
rareCount	optional integer, allow levels with this count or below to be pooled into a shared rare-level. Defaults to 0 or off.
rareSig	optional numeric, suppress levels from pooling at this significance value greater. Defaults to NULL or off.
collarProb	what fraction of the data (pseudo-probability) to collar data at if doCollar is set during <code>prepare.treatmentplan</code> .
scale	optional if TRUE replace numeric variables with regression ("move to outcome-scale").
doCollar	optional if TRUE collar numeric variables by cutting off after a tail-probability specified by collarProb during treatment design.
splitFunction	(optional) see <code>vtreat::buildEvalSets</code> .
ncross	optional scalar ≥ 2 number of cross-validation rounds to design.
forceSplit	logical, if TRUE force cross-validated significance calculations on all variables.
verbose	if TRUE print progress.
parallelCluster	(optional) a cluster object created by package <code>parallel</code> or package <code>snow</code> .
use_parallel	logical, if TRUE use parallel methods.
customCoders	additional coders to use for variable importance estimate.
codeRestriction	codes to restrict to for variable importance estimate.
missingness_imputation	function of signature <code>f(values: numeric, weights: numeric)</code> , simple missing value imputer.
imputation_map	map from column names to functions of signature <code>f(values: numeric, weights: numeric)</code> , simple missing value imputers.

Value

table of variable valuations

variable_values	<i>Return variable evaluations.</i>
-----------------	-------------------------------------

Description

Return variable evaluations.

Usage

`variable_values(sf)`

Arguments

sf scoreFrame from from vtreat treatments

Value

per-original variable evaluations

vnames *New treated variable names from a treatmentplan\$treatment item.*

Description

New treated variable names from a treatmentplan\$treatment item.

Usage

vnames(x)

Arguments

x vtreatment item

See Also
